Yakima County Regional Shoreline Master Program User’s Guide

Introduction

This User’s Guide provides a framework for the organization of the Yakima County Regional Shoreline Master Program (SMP), Yakima County Code Title 16D. This regulation can be complicated and difficult to understand. An appreciation of the organization of the law helps make sense of complicated language and gives insight into how the ordinances are applied.

The User’s Guide is divided into four parts: legal requirements, organization of the code, protection of critical areas, and permit review. Legal requirements for the SMP are located in state law and affect the organization of local regulations. The next section describes the organization of the regulations to provide a general understanding of the ordinances. The third part outlines the protective measures for individual critical areas. A description of the permit process is provided last, to illustrate how a proposed project would go through the permitting process.

It is important to remember that ordinance standards only apply to new development, including changes in use. Lawfully established uses may continue to operate as they historically have without a requirement to change their practices.

Legal Requirements to Protect Shorelines

The Shoreline Management Act of 1971 (SMA) requires Yakima County to adopt a Shoreline Master Program. The SMA (RCW 90.58) requires local governments to adopt a SMP to regulate development within shorelands (Shoreline jurisdiction). Shorelands are defined as all marine waters, streams and rivers with greater than 20 cubic feet per second mean annual flow, lakes larger than 20 acres, upland areas that extend 200 feet landward from the edge of these waters, and wetlands associated with Shoreline rivers. SMPs include regulations to protect critical areas that occur within Shoreline jurisdiction. SMP guidelines require that “the most current, accurate and complete scientific and technical information available” be used in development of a SMP.

Organization

The CAO and SMP are organized in parallel structure, with similar chapters and requirements. Both ordinances regulate critical areas; which ordinance applies depends on whether the critical area is inside or outside of Shoreline jurisdiction. There is no overlap between the CAO and SMP; the CAO protects critical areas outside Shoreline jurisdiction, the SMP protects critical areas within Shoreline jurisdiction. State laws mandate that critical areas found within Shoreline jurisdiction receive equal or greater protection than critical areas outside Shoreline jurisdiction.

Types of Requirements – Two types of requirements apply to every project. Each project will need to meet a set of Permit Requirements (listed in Chapter 3 – Application and
Review Procedures) and a set of Specific Critical Area Requirements (found in chapters on the affected critical areas).

1) **Permit requirements** – All new development, construction and uses within Shoreline jurisdiction require development authorization. Shoreline permits include Shoreline Exemptions, Shoreline Substantial Development Permits, Shoreline Variances, and Shoreline Conditional Use Permits.

2) **Specific critical area requirements** – There are General Policies and Standards that apply to any development, construction, or use carried out within a designated critical area. In addition to the general policies and standards, individual critical areas and activities have specific standards.

Components of any development, construction, or use requiring a permit also conform to “use classification” criteria. Use classifications relate a project’s water dependency to buffers. For example, bridges are inherently water dependent in that they must be constructed over a stream. Water dependent uses do not need to meet buffer requirements, while non-water dependent uses need to meet buffer requirements.

**How Different Critical Areas are Protected**

Each type of critical area has its own chapter within the SMP. Those chapters outline the purpose and intent of the chapter and also the County’s approach taken to protect the specific critical area through specific development standards.

**Flood Hazard Areas (Chapter 5)** – This chapter contains the County’s Flood Hazard regulations that are necessary for County residents to be eligible for flood insurance. The Yakima County Chief Building Official administers Chapter 5 through a separate permitting process.

**Fish and Wildlife Habitat and the Stream Corridor System (Chapter 6)** – Aquatic and riparian habitats (habitats found in or near water) are Hydrologically Related Critical Areas (HRCAs) in the SMP, and addressed in this chapter. The HRCA chapter contains three types of development standards which are grouped together under named headers in the chapter, they include:

1. **General Development Standards** – These apply to all developments and include prohibited uses.

2. **Buffers and Water Dependency Development Standards** – Different parts of a project are more water-dependent than others. Those parts that are water-dependent may not need to meet the buffer requirements, while those that aren’t must meet the buffer requirements.

3. **Land Modification Development Standards** – Different parts of a project involve different types of facilities or work, such as building roads, installing utilities, excavation, or filling. Development standards for those activities are required to be met whenever applicable.
Wetlands (Chapter 7) – The County’s protection approach for wetlands relies on the Fish and Wildlife Habitat protection measures in Chapter 6 to protect wetlands. Yakima County has four categories of wetlands based on their functions and values. Criteria for the wetland categories are provided in the Washington State Wetland Rating System for Eastern Washington, revised August 2004.

Geologic Hazards (Chapter 8) – Geologically hazardous areas include those areas susceptible to geological events, such as earthquakes and landslides. The purpose of the Geologically Hazardous Areas chapter is to minimize risks to public health and safety, to maintain natural geological processes while protecting development, and to establish a review process for development proposals in geologically hazardous areas. The County relies on the International Building Code (IBC) for addressing many geologic hazards, but also establishes a system to review types not covered by the IBC.

Critical Aquifer Recharge Areas (Chapter 9) – Critical aquifer recharge areas (CARAs) are those areas with a critical recharging effect on aquifers used for potable water. The CAO designates and protects CARAs through the review of performance standards. The SMP relies on other regulatory programs, such as Federal and State water quality laws, the County’s building codes, and stream corridor and wetland protections measures, which include prohibited uses that are focused on contaminating activities.

Shoreline (Chapter 10) – Chapter 10 defines the extent of Shoreline jurisdiction and establishes different Shoreline Environments. The Shoreline Environments are a system of categorizing shoreline areas according to management objectives and the character of the shoreline. Table 16D.10.05 of Chapter 10 lists the uses and activities for each shoreline environment designation that are allowed. Allowed uses are reviewed with regards to the development standards found in the other chapters.

Upland Wildlife Habitat Conservation Areas (Chapter 11) – Upland Wildlife Habitat Conservation Areas (UWHCA) are areas within the county where state or federally designated endangered, threatened, or sensitive species have a primary association. Developments proposed within UWHCA may require a habitat assessment if it is determined that the development proposal could impact the UWHCA. The County relies on existing large lot zoning districts to protect existing blocks of upland habitat and keep human pressure on animals low. The County also relies on existing State and Federal wildlife habitat programs.

How a Permit is Reviewed

The following flowchart describes how the SMP works by taking an applicant through the review process and referencing or discussing the important parts of the ordinance. Notice that a major component of review is focused on Inquiry and Early Assistance. There are two primary reasons for this: first, the location of critical areas needs to be determined. Critical area maps are intended as a reference and act as a “red flag” which will cause staff to look more closely at available information, and determine actual critical area presence on the site rather than assuming the map is correct. Maps
are improved and corrected as site specific information becomes available. Secondly, emphasis is placed on assisting applicants to design their project to meet the standards before extensive time and money is expended on plans that do not meet the standards. Additional information on each of the questions of the flowchart is provided below.

**Is the project inside or outside Shoreline jurisdiction?** – If a proposal is inside Shoreline jurisdiction, then Shoreline review is needed.

**Is the SMP applicable to the project?** – Some projects do not need SMP review. These projects are typically minor activities that do not require a permit. If the SMP is applicable to the proposal, then a Pre-application Conference is required. A Pre-Application Conference is a site visit or a face-to-face meeting between the applicant or their representative and an Environmental and Natural Resources planner. The purpose of Pre-application Conference is primarily to establish the scope of the project, identify which type of permit will be required, and to provide assistance in meeting the provisions of the applicable regulations.

**Does project qualify for a Shoreline Exemption?** – Within Shoreline jurisdiction, certain types of projects may qualify for a Shoreline Exemption. These projects are exempt from the Shoreline permitting process, but not the permit requirements or development standards. If any part of a proposed development is not eligible for an exemption, then the entire development proposal will need a Shoreline Substantial Development Permit. If a proposed development does not comply with the performance standards, then a Shoreline Variance is required.

**A permit is required** – Once a complete application is received, Planning staff will process the application using the procedures (notices, hearing, appeals, etc.) of Title 16B (Project Permit Administrations), and any special process requirement of the relevant permit types. Planning staff reviews the application for conformance with general critical areas development standards and specific development standards found in the chapters. The Administrative Official then issues a decision based on the findings of that review. Processing of a Shoreline Permit may take a few weeks for a Shoreline Exemption and six to eight months for the other types of Shoreline permits. Shoreline Conditional Use Permits and Shoreline Variances are sent to the Washington State Department of Ecology (DOE) for final approval, denial, or approval with DOE’s conditions.
Is the project inside Shoreline jurisdiction?
- YES: Shoreline review is required
- NO: Shoreline review is not needed

Is the SMP applicable to the project?
- YES: Shoreline permitting is not needed

Pre-application Conference
- Set up the required pre-application meeting and/or site visit.
- Determine whether a more detailed critical area report is needed.
- Determine the likely permitting process and associated requirements.
- Provide guidance concerning project modifications or site enhancements that would eliminate or minimize impacts to the critical area.
- Review buffer requirements and development standards.
- Provide guidance to meet standards and advise about other agencies requirements (WDFW, WADOE, USACE, etc.)

Submit Permit Application
Determine if all submittal items are provided for a complete application.

Permit Processing
Once a complete application is received, planning staff processes the application using the procedures (notices, hearing, appeals, etc.) of Title 16B (Project Permit Administrations), AND any special process requirement of the relevant permit types.
- Exemption
- Substantial Development Permit
- CUP/Variance

Review Criteria
Planning staff reviews the application for conformance with general critical areas development standards and specific development standards found in the chapters.

Issue Decision
The Administrative Official issues a decision based on a review of the general criteria, and the decision criteria found in the section for relevant permit types.

Determination of Completeness
- Exemption: 28 days
- Substantial Development Permit: 28 days
- CUP/Variance: 28 days

Shoreline Permit is issued
- All Shoreline Permits, except Shoreline Exemptions, have a 14-day appeal period

Shoreline Permit is filed to DOE
- N/A
- Substantial Development Permit: 72 (86)* days
- CUP/Variance: 72 (86)* days

Shoreline Permit is filed to DOE after the local appeal period is up
- N/A
- Substantial Development Permit: 100 (121)* days
- CUP/Variance: 121 (142)* days

* Shoreline permits, except Shoreline Exemptions, have a 30-day comment period
* There is a 21-day appeal period starting from the “date of filing”
